ABSTRACT:

PROBLEM TO BE SOLVED: To make the answer of an electronic mail very easy by fetching image data inputted in handwriting on a display screen, displaying the image data, overlapping it on displayed text data and transferring the handwritten image data together with the text data as an answering mail.

SOLUTION: A CPU 2 converts handwritten image data on a touch panel which is taken in to RAM into an electronic mail format and also converts a text document shown on a display 8 into a electronic mail format. An answering mail

in which the image data is attached to the text document is sent to the address of the other party. The address of the other party is preliminarily registered as a table in RAM of the CPU 2, an address is decided on the table based on an operator's input, and the data is sent by automatically dialing to the address with an automatic dialer 9.
